colour mixing

Primaries of Light are **RED, GREEN, BLUE**
Secondaries of Light are Purple (Magenta), Light Blue (Cyan) and Yellow (Amber)

Primaries of Paint are **RED, YELLOW, BLUE**

The picture above shows **ADDITIVE** colour mixing: three different lanterns focussed on the same area. The primary colours are added together to get close to white.

SUBTRACTIVE colour mixing occurs when you hold more than one colour in front of the same lantern. If you subtractively mix the primary colours, you get a very dark brown (perfect primary colours would give you black).
